Are you considering facial feminization surgery? Are you transitioning, but have a prominent chin, a heavy brow, or a strong lower jaw that you feel detracts from your femininity? Would you like your appearance to more closely match the way you feel inside? If so, perhaps you're considering facial feminization surgery (FFS). For many transgendered women, having their facial features refined is an important step in their transition. Some individuals consider it the most essential part of their transformation. Jordan Deschamps-Braley, M.D., is an accomplished plastic surgeon who specializes in FFS. His partner, Douglas Ousterhout, M.D., is a pioneer in FFS and has performed these surgeries for decades. Topics they cover include: scalp advancement, forehead feminization, temple

augmentation, cheek contouring, nose reshaping, lip reshaping, chin feminization, lower jaw tapering, thyroid cartilage reduction, lower jaw repositioning, upper jaw repositioning, facelifts, and hair transplants. The authors also provide information on the recovery process for each procedure as well as side effects to expect and potential complications. This book also contains before-and-after photos of FFS patients.

Georg von Bekesey was awarded the Nobel Prize for his seminal everyone all over the world. In other words it is directed toward work on hearing. It was, however, 43 years later in 2004 that evolving a common scientific language that is spoken uniformly Linda Buck and Richard Axel were awarded the Nobel Prize for and consistently all over the world. Universality, so that norms, their work on olfaction. Tis is indicative of how the science of staging systems, etc., can be applied anywhere in the world with rhinology is only now coming into its own. For quite some time, equal validity. Tis can only be achieved through consensus. rhinology was

thought to be limited in scope. It is now appreciated that the nose is not only an organ of aesthetic appeal, but rhinologic disease, but also what all surgeons want and that is one that carries out several important, complex functions. The operative steps to bring about successful resolution of disease, tremendous surge in medical literature in recent times bears with the return of normal function.

In the summer of 2015, shortly after Caitlyn Jenner came out as transgender, the NAACP official and political activist Rachel Dolezal was "outed" by her parents as white, touching off a heated debate in the media about the fluidity of gender and race. If Jenner could legitimately identify as a woman, could Dolezal legitimately identify as black? Taking the controversial pairing of "transgender" and "transracial" as his starting point, Rogers Brubaker shows how gender and race, long understood as stable, inborn, and unambiguous, have in the past few decades opened up—in different ways and

to different degrees—to the forces of change and choice. Transgender identities have moved from the margins to the mainstream with dizzying speed, and ethnoracial boundaries have blurred. Paradoxically, while sex has a much deeper biological basis than race, choosing or changing one's sex or gender is more widely accepted than choosing or changing one's race. Yet while few accepted Dolezal's claim to be black, racial identities are becoming more fluid as ancestry—increasingly understood as mixed—loses its authority over identity, and as race and ethnicity, like gender, come to be understood as something we do, not just something we have. By rethinking race and ethnicity through the multifaceted lens of the transgender experience—encompassing not just a movement from one category to another but positions between and beyond existing categories—Brubaker underscores the malleability, contingency, and arbitrariness of racial categories. At a critical time when gender and race are being reimaged and reconstructed, Trans explores fruitful new paths for

thinking about identity.

Early surgical procedures intended to change a person's sex focused on the genitals as the site of a body's maleness or femaleness, and took the reconstruction of these organs as the means

by which, & ldquo;sex& ldquo; could be changed. However, in the mid& ndash1980s a novel set of techniques was developed in order to change a part of the body that proponents claim plays a more central role in the assessment and attribution of sex in everyday life: the face. Facial Feminization Surgery (FFS)& mdasha set of bone and soft tissue surgical procedures intended to feminize the faces of male& ndashto& ndashfemale transsexuals& mdashis predicated upon the notion that femininity is a measurable quality that can be both reliably assessed and surgically reproduced. Such an assertion begs the questions: What does a woman look like? What forms of knowledge are used to support a claim to know? This project examines these questions through ethnographic research situated in the offices and operating rooms of prominent American surgeons who perform FFS. I explore the tensions between two different forms of knowledge that surgeons rely on and appeal to in the identification and surgical reproduction of femininity: scientific and aesthetic. The status of & ldquo;the feminine& ldquo; at work in Facial Feminization is one that sometimes finds its sense through a link to the biological category of & ldquo;the female& ldquo; and other times describes the aesthetic category of & ldquo;the

beautiful. Though the tension between the female and the beautiful is one that is well worn, it is complicated here by the long and contested ethical and medical status of the transsexual body as a site of sex changing interventions. FFS unfolds at the edge of an ongoing history that draws the contested medical and ethical treatment of trans bodies into the rapidly changing field of contemporary trans medicine in the United States. My analysis of FFS, engages with this history and to show how its invocation and articulation in the present gives shape to the ethical and practical dynamics at work in the clinic. From examinations to final sutures, I show how the distinct histories and epistemologies involved in FFS create new forms of knowledge about the feminine body and, in the process, new ways of conceiving of and living in the transsexual body. The first famous transgender person in the United States, Christine Jorgensen, traveled to Denmark for gender reassignment surgery in 1952. Jorgensen became famous during the ascent of postwar dreams about the possibilities for technology to transform humanity and the world. In *Mobile Subjects* Aren Z. Aizura examines transgender narratives within global health and tourism economies from 1952 to

the present. Drawing on an archive of trans memoirs and documentaries as well as ethnographic fieldwork with trans people obtaining gender reassignment surgery in Thailand, Aizura maps the uneven use of medical protocols to show how national and regional health care systems and labor economies contribute to and limit transnational mobility. Aizura positions transgender travel as a form of biomedical tourism, examining how understandings of race, gender, and aesthetics shape global cosmetic surgery cultures and how economic and racially stratified marketing and care work create the ideal transgender subject as an implicitly white, global citizen. In so doing, he shows how understandings of travel and mobility depend on the historical architectures of colonialism and contemporary patterns of global consumption and labor.

caused by the aging process. It also describes the surgical anatomy of the forehead, face, neck and eyelids. The third section provides a comprehensive overview of the basic techniques of facelift with details of refined surgical approaches for each segment of the face and neck. It highlights liposuction techniques, lipo-injection as well as transference of stem cells, showing their importance in reshaping the facial contours. It addresses both the treatment of soft tissue and craniofacial bone structures to improve the aesthetics of the face. The next sections present the final scars after face-lifting, minimally invasive procedures as complementary approaches during rhytidoplasty and the associated procedures during rhytidoplasty. The last section discusses postoperative care. Aesthetic Facial Surgery consists of 64 chapters focusing on all aspects of face lifting, and meticulously describes surgical details not covered in other medical books. Featuring numerous figures, photographs and videos, it is a valuable resource for young and experience surgeons alike around the world.

In recent years transgender has emerged as a subject of increasing social and cultural interest. This volume offers vivid accounts of the diversity of living transgender in today's world. The first section, "Emerging Identities," maps the ways in

which social, cultural, legal and medical developments shape new identities on both an individual and collective level. Rather than simply reflecting social change, these shifts work to actively construct contemporary identities. The second section, "Trans Governance," examines how law and social policy have responded to contemporary gender shifts. The third section, "Transforming Identity," explores gender and sexual identity practices within cultural and subcultural spaces. The final section, "Transforming Theory?", offers a theoretical reflection on the increasing visibility of trans people in today's society and traces the challenges and the contributions transgender theory has brought to gender theory, queer theory and sociological approaches to identity and citizenship. Featuring contributions from throughout the world, this volume represents the cutting-edge scholarship in transgender studies and will be of interest to scholars and students interested in gender, sexuality, and sociology.

Imagine yourself without a face—the task seems impossible. The face is a core feature of our physical identity. Our face is

how others identify us and how we think of our 'self'. Yet, human faces are also functionally essential as mechanisms for communication and as a means of eating, breathing, and seeing. For these reasons, facial disfigurement can endanger our fundamental notions of self and identity or even be life threatening, at worse. Precisely because it is so difficult to conceal our faces, the disfigured face compromises appearance, status, and, perhaps, our very way of being in the world. In Saving Face, sociologist Heather Laine Talley examines the cultural meaning and social significance of interventions aimed at repairing faces defined as disfigured. Using ethnography, participant-observation, content analysis, interviews, and autoethnography, Talley explores four sites in which a range of faces are "repaired:" face transplantation, facial feminization surgery, the reality show Extreme Makeover, and the international charitable organization Operation Smile,. Throughout, she considers how efforts focused on repair sometimes intensify the stigma associated with disfigurement. Drawing upon experiences volunteering at a camp for children

with severe burns, Talley also considers alternative interventions and everyday practices that both challenge stigma and help those seen as disfigured negotiate outsider status. Talley delves into the promise and limits of facial surgery, continually examining how we might understand appearance as a facet of privilege and a dimension of inequality. Ultimately, she argues that facial work is not simply a conglomeration of reconstructive techniques aimed at the human face, but rather, that appearance interventions are increasingly treated as lifesaving work. Especially at a time when aesthetic technologies carrying greater risk are emerging and when discrimination based on appearance is rampant, this important book challenges us to think critically about how we see the human face.

This clearly structured and beautifully illustrated atlas, which includes numerous high-quality pre-, intra-, and postoperative pictures, documents the techniques employed in order to deal

with the problems typically encountered following a previous failed rhinoplasty. Each chapter also contains a description of the authors' standard procedure for treating the problem in question and describes the precautions to be taken in order to avoid similar failures. The techniques covered include extracorporeal and total septal reconstruction, reconstruction of the over resected tip, the sliding technique for reduction of the over projected tip, the use of alloplastic fascia or alternatively free diced cartilage for camouflaging or volume augmentation, and saddle nose correction. Mastering Advanced Rhinoplasty will be of value to both novice and experienced practitioners seeking to achieve the best results for patients who frequently present with challenging problems.

moral concept of fairness into specific criteria by which to measure which reform proposals are more fair and why. It pinpoints what market-based reforms need to do to be fair to everyone.

In *Going Stealth* Toby Beauchamp demonstrates how the enforcement of gender conformity is linked to state surveillance practices that identify threats based on racial, gender, national, and ableist categories of difference. Positioning surveillance as central to our understanding of transgender politics, Beauchamp examines a range of issues, from bathroom bills and TSA screening practices to Chelsea Manning's trial, to show how security practices extend into the everyday aspects of our gendered lives. He brings the fields of disability, science and technology, and surveillance studies into conversation with transgender studies to show how the scrutinizing of gender nonconformity is motivated less by explicit transgender identities than by the perceived threat that gender nonconformity poses to the U.S. racial and security state.

Beauchamp uses instances of gender surveillance to demonstrate how disciplinary power attempts to produce conformist citizens and regulate difference through discourses of security. At the same time, he contends that greater visibility and recognition for gender nonconformity, while sometimes beneficial, might actually enable the surveillance state to more effectively track, measure, and control trans bodies and identities.

When Richard and Sally Price stepped out of the canoe to begin their fieldwork with the Saamaka Maroons of Suriname in 1966, they were met with a mixture of curiosity, suspicion, ambivalence, hostility, and fascination. With their gradual acceptance into the community they undertook the work that would shape their careers and influence the study of African American societies throughout the hemisphere for decades to come. In Saamaka Dreaming they look back on the experience, reflecting on a discipline and a society that are considerably different today. Drawing on thousands of pages of field notes, as well as recordings, file cards, photos, and sketches, the Prices retell and comment on the most intensive fieldwork of their careers,

evoked the joys and hardships of building relationships and trust, and outline their personal adaptation to this unfamiliar universe. The book is at once a moving human story, a portrait of a remarkable society, and a thought-provoking revelation about the development of anthropology over the past half-century.

Developed in the United States in the 1980s, facial feminization surgery (FFS) is a set of bone and soft tissue reconstructive surgical procedures intended to feminize the faces of trans- women. While facial surgery was once considered auxiliary to genital surgery, many people now find that these procedures confer distinct benefits according to the different models of sex and gender in which they intervene. Surgeons advertise that FFS not only improves a trans- woman's appearance; it allows her to be recognized as a woman by those who see her. In *The Look of a Woman* Eric Plemons foregrounds the narratives of FFS patients and their surgeons as they move from consultation and the operating room to postsurgery recovery. He shows how the increasing popularity of FFS represents a shift away from genital-based conceptions of trans- selfhood

in ways that mirror the evolving views of what is considered to be good trans- medicine. Outlining how conflicting models of trans- therapeutics play out in practice, Plemons demonstrates how FFS is changing the project of surgical sex reassignment by reconfiguring the kind of sex that surgery aims to change.

This book is especially focused on the surgical aspect on Gender Dysphoria. Male to female surgery is widely discussed as well as the female to male conversion. Full information on hormone administration and surgical procedures are provided. Mental health issues are also described, as well as ethics, the law and psychosocial issues. The text is extensively referenced and includes numerous photos, tables and figures to clearly illustrate information. Based on collaboration between international experts in transgender health, this book is an essential guide for health care professionals, educators, students, patients and patients' families concerning the psychological, hormonal, surgical and social support of transgender individuals.

images, Oculofacial, Orbital, and Lacrimal Surgery: A Compendium is written and edited by international leaders in fields spanning ophthalmology, otolaryngology, oral and maxillofacial surgery, and plastic surgery. Covering topics such as embryology, anatomy, and physiology of the lacrimal system, imaging for orbital diseases and thyroid-related ophthalmology, and flap geometry and planning, this book is an excellent resource for those in training, as well as seasoned clinicians looking to stay current. This book is divided into five sections: Eyelid, Oculofacial, Lacrimal, Orbit, and Socket, with each section containing detailed chapters addressing evaluation, imaging, and various surgical approaches and management. Designed to not only provide an anatomical and surgical guide for all three types of surgeries, but to help physicians avoid mistakes and correct complications of patients referred to them, Oculofacial, Orbital, and Lacrimal Surgery: A Compendium is the definitive, authoritative reference on this complex field.

In the highly popular MACS-Lift Short-Scar Rhytidectomy, Drs. Patrick Tonnard and Alexis Verpaele introduced surgeons to an exciting new concept in facial rejuvenation-one that offered shorter incisions, minimal morbidity, and reduced recovery time. In this companion volume, Short-

Scar Face Lift: Operative Strategies and Techniques, Drs. Tonnard and Verpaele build on that foundation and expand their scope. The book is organized into two sections. Part I, **Short-Scar Face-Lift Techniques**, discusses indications, applications, and alternate short-scar face-lift techniques. The editors elaborate on the different aspects of the MACS-lift and short-scar face-lifting. They review the important lessons they have learned during years of experience with the MACS-lift, including a discussion of complications, problems, limitations, and technical tips and tricks. They are joined by Dr. Foad Nahai, who discusses technical considerations; Dr. Joseph Hunstad, who provides a systematic step-by-step guide to his approach; Dr. Mark Jewell, who describes the biomechanics of the MACS-lift and offers technical tips for success; and Dr. Daniel Baker, who describes his personal lateral SMASectomy short-scar face-lift technique and compares it to other comparable and convergent techniques. Part II focuses on **Combined Approaches and Ancillary Treatments** for facial rejuvenation. In this section, Dr. Daniel Labb discusses the anatomic basis of minimally invasive neck correction through a short scar and Dr. Alain Fogli details his simple, safe technique for temporal lifting. Finally, Dr. Thomas Roberts brings all of these

techniques and treatments into perspective through his analysis of the volumetric concept of facial rejuvenation. He provides an in-depth discussion of facial fat micrografting and describes how the synergistic use of multiple surgical and nonsurgical modalities can lead to superior results. With beautiful, four-color illustrations, numerous case examples, and an accompanying DVD with operative videos, this book provides the ultimate surgical instruction that will allow surgeons to incorporate this procedure into their practice.

The Look of a Woman

Nose reconstructions have been common in India for centuries. South Korea, Brazil, and Israel have become international centers for procedures ranging from eyelid restructuring to buttock lifts and tummy tucks.

Argentina has the highest rate of silicone implants in the world. Around the globe, aesthetic surgery has become a cultural and medical fixture. Sander

Gilman seeks to explain why by presenting the first systematic world history and cultural theory of aesthetic surgery. Touching on subjects as diverse as getting a "nose job" as a sweet-sixteen birthday present and the removal of male breasts in seventh-century Alexandria, Gilman argues that aesthetic surgery has such universal appeal because it helps people to "pass," to be seen as a member of a group with which they want to or need to identify. Gilman begins by addressing basic questions about the history of aesthetic surgery. What surgical procedures have been performed? Which are considered aesthetic and why? Who are the patients? What is the place of aesthetic surgery in modern culture? He then turns his attention to that focus of countless human anxieties: the nose. Gilman discusses how people have reshaped their noses to repair the ravages of war and disease (principally syphilis), to match prevailing ideas of beauty, and to avoid association with negative images of the "Jew," the "Irish," the "Oriental," or the "Black." He examines how we have used aesthetic surgery on almost every conceivable part of the body to try to pass as younger, stronger, thinner, and more erotic. Gilman also explores some of the extremes of surgery as personal transformation, discussing transgender surgery, adult circumcision and foreskin restoration, the

enhancement of dueling scars, and even a performance artist who had herself altered to resemble the Mona Lisa. The book draws on an extraordinary range of sources. Gilman is as comfortable discussing Nietzsche, Yeats, and Darwin as he is grisly medical details, Michael Jackson, and Barbra Streisand's decision to keep her own nose. The book contains dozens of arresting images of people before, during, and after surgery. This is a profound, provocative, and engaging study of how humans have sought to change their lives by transforming their bodies. Advanced oral and maxillofacial surgery encompasses a vast array of diseases, disorders, defects, and deformities as well as injuries of the mouth, head, face, and jaws. It relates not only to treatment of impacted teeth, facial pain, misaligned jaws, facial trauma, oral cancers, jaw cysts, and tumors but also to facial cosmetic surgery and placement of dental and facial implants. This specialty is evolving alongside advancements in technology and instrumentation. Volume 1 has topped 132,000 chapter downloads so far, and Volume 2 is being downloaded at the same pace! Volume 3 is basically the sequel to Volumes 1 and 2; 93 specialists from nine countries contributed to 32 chapters providing comprehensive coverage of advanced topics in OMF surgery.

Imagine yourself without a face—the task seems impossible. The face is a core feature of our physical identity. Our face is how others identify us and how we think of our ‘self’. Yet, human faces are also functionally essential as mechanisms for communication and as a means of eating, breathing, and seeing. For these reasons, facial disfigurement can endanger our fundamental notions of self and identity or even be life threatening, at worse. Precisely because it is so difficult to conceal our faces, the disfigured face compromises appearance, status, and, perhaps, our very way of being in the world. In Saving Face, sociologist Heather Laine Talley examines the cultural meaning and social significance of interventions aimed at repairing faces defined as disfigured. Using ethnography, participant-observation, content analysis, interviews, and autoethnography, Talley explores four sites in which a range of faces are “repaired:” face transplantation, facial feminization surgery, the reality show Extreme Makeover, and the international charitable organization Operation Smile. Throughout, she considers how efforts focused on repair sometimes intensify the stigma associated with disfigurement. Drawing upon experiences volunteering at a camp for children with severe burns, Talley also considers alternative interventions and everyday practices that both

challenge stigma and help those seen as disfigured negotiate outsider status. Talley delves into the promise and limits of facial surgery, continually examining how we might understand appearance as a facet of privilege and a dimension of inequality. Ultimately, she argues that facial work is not simply a conglomeration of reconstructive techniques aimed at the human face, but rather, that appearance interventions are increasingly treated as lifesaving work. Especially at a time when aesthetic technologies carrying greater risk are emerging and when discrimination based on appearance is rampant, this important book challenges us to think critically about how we see the human face.

A practical guide to facial-feminization surgery for the male who is transitioning to female, this book focuses on a pioneering form of cosmetic surgery that reshapes the male facial structure. Dramatic before and after photographs and detailed illustrations of each surgery show how reconstructive surgery recontours the brow and nose ridge, reduces the size of the jawbone and chin, and reshapes the trachea to eliminate the Adam's apple.
