Abstract. A GIS-based approach was designed to spatially estimate direct use value of ecosystem services and to map results for a case study at county scale. The approach highlights the use of GIS to collect data, perform spatial analysis, and map economic values of ecosystem services. Three key steps of spatial valuation for agricultural products, forest products, and tourism services were illustrated in the GIS-based technical framework.

GIS is an information system technology with geography at its core foundation. GIS provides technology and methods for data integration, spatial analysis, and collaboration. GIS also provides a science-based framework for organizing workflows that integrate all the factors that need to be considered for decision making.

~~A Gis Based Approach For Hazardous Dam Assessment ...~~

One such approach involves the use of a geographic information system (GIS). In general, a GIS is designed to store, process, retrieve, and display spatially referenced data. In situations where complex environmental relationships exist, it has been found that data concerning different aspects of the physical environment can be used more effectively in combination than

~~Estimating the Renewable Energy Potential in Africa: A GIS ...~~

Multivariate statistic approaches (Principal

Component Analysis and Cluster Analysis) were adopted for data treatment, allowing the identification of three main factors controlling the heavy metal variability in cultivated soils.

Geostatistics were used to construct regional distribution maps, to be compared with the geographical, geologic and land use regional database using GIS software.
