The survey shows that in channel environments with known KCS parameters, a variety of denoising strategies can be deployed for improved system BER performance. Of these, the threshold obtained by minimizing MSE, renders better BER performance close to that of MMSE, with the help of known three known KCS parameters, namely channel length, AWGN noise variance and number of channel taps.

A survey on OFDM channel estimation techniques based on ...

Least Square(LS) and Minimum mean square(MMSE) error based estimators are used for estimating the channel at pilot frequencies and channel interpolation is done using linear interpolation, second order interpolation, spline cubic interpolation.

A Survey on Pilot Symbol Assisted Channel Estimation in ...

Channel Estimation In a wireless communication link, channel state information (CSI) provides the known channel properties of the link. The CSI should be estimated at the receiver and usually fed back to the transmitter. Therefore, the transmitter and receiver can have different CSI.

Different Types of Channel Estimation Techniques Used in ...

The survey groups CSI-based WiFi sensing applications into three categories, detection,

surveys make detail analysis on crowd counting and scene analysis, they are only for traditional methods with hand-crafted features. In recent work, Sindagi et al. [67] provide a survey of recent state-of-the-art CNN-based approaches for crowd counting and density estimation for the single image.

CNN-based Density Estimation and Crowd Counting: A Survey

A Comprehensive Survey of Pilot Contamination in Massive MIMO—5G System. Abstract: Massive MIMO has been recognized as a promising technology to meet the demand for higher data capacity for mobile networks in 2020 and beyond. Although promising, each base station needs accurate estimation of the channel state information (CSI), either through feedback or channel reciprocity schemes in order to achieve the benefits of massive MIMO in practice.

However, practical and realistic MIMO transceivers suffer from a huge range of challenging bottlenecks in design the majority of which belong to the issue of channel-estimation. Channel modeling and prediction in MIMO particularly suffer from computational complexity due to a high number of antenna sets and supported users.
