For the trinomial to be factorable, we would have to be able to find two integers with product 36 and sum ; that is, would have to be the sum of two integers whose product is 36. Below are the five factor pairs of 36, with their sum listed next to them. must be one of those five sums to make the trinomial factorable. 1, 36: 37. 2, 18: 20

Factoring Trinomials. Factoring trinomials is probably the most common type of factoring in Algebra. In this lesson, we will factor trinomials that have a lead coefficient of 1. To begin this lesson, it is important for you to understand the process of multiplying binomials using the FOIL method. Please be sure to review that lesson before starting this lesson.

Correct answer: \displaystyle \frac {x+3} {2x} Explanation: By factoring both the numerator and the denominator we get the following: \displaystyle \frac {\left (x+1 \right)\left (x-1 \right)\left (x+3 \right)} {\left (x+1 \right)\left (x-1 \right)2x} If we simplify we get: \displaystyle \frac {x+3} {2x}

Solve the quadratic equation x 2 + 4 x + 3 = 0. The roots are x 1 = ? 1, x 2 = ? 3 (use the quadratic equation calculator to see the steps). Therefore, x 2 + 4 x + 3 = 1 (x + 1) (x + 3). (x 2 + 4 x + 3) = 1 (x + 1) (x + 3) Rewrite: 1 (x + 1) (x + 3) = (x + 1) (x + 3) Thus, x 2 + 4 x + 3 = (x + 1) (x + 3).

Since the product is positive (18) and the sum is positive (9), you need both factors to be positive. Make a list of the possible factor pairs with a product of 18, and then find the one with a sum of 9. The factors 3 and 6 have a sum of 9. So, replace the quadratic's. and then factor by grouping.

In factoring the general trinomial, begin with the factors of 12. These include the following: 1, 12, 2, 6, 3, 4. As a general rule, the set of factors closest together on a number line should be tried first as possible factors for the trinomial. The only factors of the last term of the trinomial are 1 and 3, so there are not other choices to try. Because the last term is negative the signs of the factors 1 and 3 must be opposite.

Multiplying (ax + 2y) (3 + a), we get the original expression 3ax + 6y + a 2 x + 2ay and see that the factoring is correct. This is an example of factoring by grouping since we "grouped" the terms two at a time. Multiply (x - y) (a + 2) and see if you get the original expression. Again, multiply as a check.
