Azure includes multiple monitoring services, each of which performs a specific role. Together, these services deliver a comprehensive solution for collecting, analyzing, and acting on data from your applications and the Azure resources they consume.

Web application monitoring on Azure - Azure Architecture ...

In operating systems architecture a reference monitor concept defines a set of design requirements on a reference validation mechanism, which enforces an access control policy on subjects' (e.g., processes and users) ability to perform operations (e.g., read and write) on objects (e.g., files and sockets) on a system. The properties of a reference monitor are captured by the acronym NEAT, which means:

Reference monitor - Wikipedia

Security Reference Monitor is a component of the Microsoft Windows NT executive running in kernel mode that acts like a security watchdog, enforcing security when applications attempt to access system resources. The Security Reference Monitor decides whether a given process should be granted access rights to an object. It does this by comparing the access token of the process to the discretionary access control list (DACL) attached to the object that the process is trying to access.
