In Mathematics, linear  
programming is a method of  
optimising operations with  
some constraints. The main  
objective of linear  
programming is to maximize  
or minimize the numerical  
value. It consists of linear  
functions which are  
subjected to the constraints  
in the form of linear

Applications of linear  
programming are everywhere  
around you. You use linear  
programming at personal and  
professional fronts. You are  
using linear programming  
when you are driving from  
home to work and want to  
take the shortest route. Or  
when you have a project  
delivery you make strategies  
to make your team work  
efficiently for on-time  
delivery.

The general process for  
solving linear-programming  
exercises is to graph the  
inequalities (called the

# Acces PDF Applied Calculus With Linear Programming For Business Economics

"constraints") to form a walled-off area on the  $x, y$ -plane (called the "feasibility region"). Then you figure out the coordinates of the corners of this feasibility region (that is, you find the intersection points of the various pairs of lines), and test these corner points in the formula (called the "optimization equation") for which you're trying to find the highest or lowest value.
