Introduction. Modern approaches to microbial classification and identification, particularly those based on nucleic acid analysis, have raised the awareness and interest of microbiologists in systematics during the past decade. The extended scope of the subject has revolutionized microbial ecology with the demonstration of uncultivable microorganisms as a major component of the biosphere and evolution, with the ribosomal RNA phylogenetic tree as the basis of current classifications.

Abstract. This chapter is intended to be a brief introduction to the concepts and practices embraced by microbial systematics, the scientific study of the kinds and diversity of microorganisms and their relationships. The subject is generally divided into three related disciplines, the taxonomic trinity recognised by Cowan (1955), namely, classification, nomenclature and identification.
