Invertebrates | Basic Biology

Invertebrate Definition. Invertebrates are animals that don't have a backbone. The vertebral column is another name for the backbone. Over 90% of all species on Earth are invertebrates, and invertebrate species have been found in the fossil record as far back as 600 million years ago. Molecular biology studies suggest that all invertebrates evolved from a single invertebrate group.

Invertebrate - Biology Dictionary

Invertebrates are animals that neither possess nor develop

a vertebral column, derived from the notochord. These include all animals apart from the subphylum Vertebrata. Invertebrates are animals with no backbone. More than 90% of the animals are invertebrates among the estimated 15-30 million animal species. Invertebrates exist about anywhere.

Invertebrates - Types of Invertebrates and its Characteristics

Two major groups of animals exist in the world: invertebrates and vertebrates. Invertebrates are animals that have no backbones, while vertebrates are animals with backbones (see Chapter 22). Among the invertebrates are numerous phyla of animals comprising approximately 95 percent of all the animal species.
