A scientific take on
the still-central
therapeutic concept of
“the unconscious.”

Page 56/207

More than one hundred years after Freud began publishing some of his seminal theories, the concept of the unconscious still occupies a central position in many theoretical frameworks and clinical approaches.

When trying to

Online Library

Casebook Of

Clinical

Neuropsychology

understand clients' internal and interpersonal struggles it is almost inconceivable not to look for unconscious motivation, conflicts, and relational patterns. Clinicians also consider it a breakthrough to recognize how our own unconscious

patterns have interacted with those of our clients.

Although clinicians use concepts such as the unconscious and dissociation, in actuality many do not take into account the newly emerging neuropsychological attributes of nonconscious

Online Library

Casebook Of

Clinical

Neuropsychology

processes. As a result, assumptions and lack of clarity overtake information that can become central in our clinical work. This revolutionary book presents a new model of the unconscious, one that is continuing to emerge from the integration of neuropsychological

research with clinical
Neuropsychology
experience. Drawing

from clinical

observations of

specific therapeutic

cases, affect theory,

research into cognitive

neuroscience and

neuropsychological

findings, the book

presents an expanded

picture of

nonconscious

processes. The model moves from a focus on dissociated affects, behaviors, memories, and the fantasies that are unconsciously created, to viewing unconscious as giving expression to whole patterns of feeling, thinking and behaving, patterns that are so integrated and

entrenched as to make them our personality traits. Topics covered include: the centrality of subcortical regions, automaticity, repetition, and biased memory systems; role of the amygdala and its sensitivity to fears in shaping and coloring unconscious self-systems; self-
