[What is classification? - BBC Bitesize](#)

After animal kingdom, animal species usually fall into one of seven different phylum, or phyla: Porifera – Marine animals more commonly known as sponges and found in every ocean on earth. Cnidaria – Mostly marine animals that include over 11,000 species. Examples include coral, jellyfish, and ...

---

[Classification of Animals: The Complete Guide | AZ Animals](#)

Classifying animals basically means dividing them into two main groups – vertebrates and invertebrates. Vertebrates have a backbone, while invertebrates are those which don't. In all, there are more than 800,000 animal species in the Kingdom Animalia and most of them are included in the phylum of Arthropod i.e. invertebrates.

---

[Classification of Animals - Biology Wise](#)

Each level of classification gets more specific, running down to the specific species that the animal is. The classification order goes like this: Kingdom, Phylum, Class, Order, Family, Genus, Species. (There actually is a Domain level of classification above kingdom, sometimes referred to as an empire or superkingdom.)

*Classification of Animal Kingdom (Animalia)*

*Anemia classification on the basis of physiological abnormality: Defective maturation of erythropoiesis. Hemolytic anemia where this is the increased breakdown of the RBCs. Defect due to an increase in RBC precursors as compared to the degree of anemia. Anemia classification on the basis of etiology:*

---

*Anemia – Part 1 – Anemia Classification, Thalassemia ...*

*In the broadest sense, animals can be classified as either vertebrates or invertebrates. However, if we look in more detail, we can separate vertebrates into reptiles, fish, amphibians, birds and mammals. With invertebrates, the main animal class is arthropods, which can be split into arachnids, crustaceans, insects and myriapods.*

---

*KS2 Science - Classification of Animals & Other Living Things*

*Animals—complex, multicellular organisms equipped with nervous systems and the ability to pursue or capture their food—can be divided into six broad categories. Here are the six main animal groups, ranging from the simplest (the spineless invertebrates) to the most complex (mammals, which can adapt to a wide range of habitats). 01 of 06*

*6 Basic Animal Groups - ThoughtCo*

*Anemia (also spelled anaemia) is a decrease in the total amount of red blood cells (RBCs) or hemoglobin in the blood, or a lowered ability of the blood to carry oxygen. When anemia comes on slowly, the symptoms are often vague and may include feeling tired, weakness, shortness of breath, and a poor ability to exercise. When the anemia comes on quickly, symptoms may include confusion, feeling ...*

---

*Anemia - Wikipedia*

*Invertebrates are animals that lack a vertebral column, or backbone. The last phylum in the table, the Chordata, also includes many invertebrate species. Tunicates and lancelets are both invertebrates. Altogether, invertebrates make up at least 95 percent of all animal species. The remaining animals are vertebrates.*

*Animal Classification Chart | vertebrates and ...*

*In biology, taxonomy is the scientific study of naming, defining and classifying groups of biological organisms based on shared characteristics. Organisms are grouped into taxa and these groups are given a taxonomic rank; groups of a given rank can be aggregated to form a super-group of higher rank, thus creating a taxonomic hierarchy. The principal ranks in modern use are domain, kingdom, phylum, class, order, family, genus, and species. The Swedish botanist Carl Linnaeus is regarded as the fou*
