Because little is known of tuberose, investigations were initiated at the Hawaii Agricultural Experiment Station to study the problems of the crop. Of the three serious diseases of tuberose found in Hawaii, two are caused by parasitic nematodes and one by a fungus. Of the two minor diseases, one is caused by an insect and bacterium and one by insects alone. 3

DISEASES OF TUBEROSE IN HAWAII

Because little is known of tuberose, investigations were initiated at the Hawaii Agricultural Experiment Station to study the problems of the crop. Of the three serious diseases of tuberose found in Hawaii, two are caused by parasitic nematodes and one by a fungus. Of the three serious diseases of tuberose found in Hawaii, two are caused by parasitic nematodes and one by a fungus. Of the two minor diseases, one is caused by an insect and bacterium and one by insects alone

Diseases of Tuberose in Hawaii - CORE

Foreigners brought diseases, such as the measles, influenza, introduced colds, viruses, and many other threatening diseases. These diseases killed about 75-80% of the pure Hawaiian population by 1819. Hawaiians had no immunity against the new diseases that the foreigners brought therefore, we have lost many of our pure Hawaiians.

Diseases Introduced to Hawaii | Sutori

Diseases of tuberose in Hawaii [C1-427] [1968] Dracaena decline and root rot [HB-103] [1992] Fairy rings: toadstools, stinkhorns, and puffballs [PD-49] [2008]

Plant Disease - University of Hawai'i

The diseases reported are stem rot, flower bud rot, leaf blight or Botrytis blight, Sclerotial wilt, Alternaria leaf spot, rust, powdery mildew etc. Stem rot. The infection is caused by the fungi Sclerotium rolfsii. The disease symptom is preceded by the appearance of prominent, coarse, mycelial masses on the leaf surface or near the soil level.

Tuberose — Vikaspedia

The tuberose is herbaceous, growing from underground tubers or tuberous roots. It produces offsets. The leaves are a dull green and about 1–1.5 ft (30–50 cm) long and up to 0.5 in (13 mm) wide at the base. They are slightly succulent. The inflorescence is a spike, reaching up to 3 ft (1 m) high, with pure white waxy flowers

Agave amica - Wikipedia

Slugs and grass hoppers, which feed on the leaves, and thrips which damage and cause distortion of the spikes are the major pests. Malathion and carbaryl are effective against these pests. No major disease is noticed. Sclerotium fungus, which attacks the leaves and flower stalks at ground level causes defoliation and toppling of spikes.

Tuberose - cel@kau.in

Bacterial blight of anthuriums: Hawaii's experience with a global disease.

Plant Parasitic Nematodes in Hawaiian Agriculture ...

Phalaenopsis. Disease spreads so rapidly that plants may be completely rotted in 2 to 3 days. The bacteria are opportunistic organisms that can enter through wounds. Dendrobium. Leaves appear yellow and water-soaked and become black and sunken. Paphiopedilum. Leaves develop small, round spots often near the middle of the leaf.

Orchid Diseases

Diseases in Tuberose Cultivation Stem Rot: The disease symptoms are preceded by the looks of prominent stains of loose green color due to rotting which goes and protects the entire leaf. The infected leaves become detached from the plant. More or less curved sclerotic, brown spots are formed on and around the infected leaf.

Tuberose Cultivation - A Beginners Guide | Agri Farming

Tuberose is an ornamental crop which is growing under tropical and sub-tropical areas. Recently, the incidence of leaf blight disease caused by *Alternaria polianthi* a fungal disease of tuberose is considered as a severe problem causing growth reduction and yield loss triggered by high temperature and humidity.

Management of Leaf Blight Disease Caused by *Alternaria* ...
