There are 3 types of RNA, and each plays an important role in protein synthesis. Messenger RNA (mRNA) brings the genetic details from DNA into the cytoplasm to the ribosomes, the sites of protein synthesis. This details is brought by the series of bases in mRNA, which is complementary to the series of bases in the DNA design

template. Ribosomal RNA (rRNA) and protein make up ribosomes, the sites of protein synthesis. Ribosomes consist of the enzymes needed for protein synthesis.

~~Protein Synthesis Process and Role of DNA And RNA In It ...~~

To make RNA, DNA pairs its bases with those of the "free" nucleotides (Figure 2). Messenger RNA (mRNA) then travels to the ribosomes in the cell cytoplasm, where protein synthesis occurs (Figure 3). The base triplets of transfer RNA (tRNA) pair with those of mRNA and at the same time deposit their amino acids on the growing protein chain.

transcription and translation. Related Searches. Genome Editing Products.

~~What Are the Roles of DNA and RNA in Protein Synthesis?~~

The syntheses of RNA (transcription), DNA and proteins (translation) are fundamental processes necessary for all life. Transcription begins by uncoiling a section of DNA that will be used as the template and is initiated by RNA polymerase binding to a promoter sequence.
