The Oxford Chemistry Primers are a series of short texts providing accounts of a range of essential topics in chemistry and chemical engineering written for undergraduate study. The first primer Organic Synthesis: The Roles of Boron and Silicon was published by Oxford University Press in 1991. As of 2017 there are 100 titles in the series, written by a wide range of authors.

[The Compton Group - books - University of Oxford](#)

Electrode Potentials. Richard G. Compton and Giles H. W. Sanders. Oxford Chemistry Primers. Description. Offering a comprehensive introduction to equilibrium electrochemistry, this primer deals with electrode potentials and their applications.

[Electrode Potentials - Oxford University Press](#)

"Electrode Potentials" by Compton & Sanders This booklet is #41 in the Oxford Chemistry Primer series. It puts together all of the necessary basics for the theory of electrode potentials. It also touches on the topics of liquid junction potentials and activity corrections and gives some background theory.

[Electrode Dynamics \(Oxford Chemistry Primers\): Amazon.co ...](#)

A galvanic cell or voltaic cell, named after Luigi Galvani or Alessandro Volta, respectively, is an electrochemical cell that derives electrical energy from spontaneous redox reactions taking place within the cell. It generally consists of two different metals immersed in electrolytes, or of individual half-cells with different metals and their ions in solution connected by a salt bridge or ...

[Galvanic cell - Wikipedia](#)

Electrode Potentials OUP UK This primer seeks to provide an introduction to the science of equilibrium electrochemistry; specifically it addresses the topics of electrode potentials and their applications.

[Oxford University Press :: Electrode Potentials ...](#)

The books in the renowned Oxford Chemistry Primers series provide accessible accounts of a range of essential topics in chemistry and chemical engineering. Written with students in mind, these books offer just the right level of detail for undergraduate study, and are invaluable as a source of material commonly presented in lectures.

[Oxford Chemistry Primers - Oxford University Press](#)

Since by convention electrode potentials are for reduction processes, an increased value of  $E^\circ$  corresponds to an increased driving force behind the reduction of the species (hence increased effectiveness of its action as an oxidizing agent on some other species). Negative values for electrode potentials are simply a consequence of assigning a value of 0 V to the SHE, indicating the reactant of the half-reaction is a weaker oxidant than aqueous hydrogen ions.
