A butterfly valve (Fig. 1) is a type of flow control device that controls the flow of gas or liquid in a variety of process. It consists of a metal circular disc with its pivot axes at right angles to the direction of flow in the pipe, which when rotated on a shaft, seals against seats in the valve body.

A butterfly valve is a flow control device that incorporates a rotational disk to control the flowing media in a process. The disk is always in the passageway, but because it is relatively thin, it offers little resistance to flow. The disk is the equivalent of a plug in a plug valve, gate in a gate valve or a ball in a ball valve.
