Press simulate in the top toolbar and use the default settings. What we want to check is the Von Mises stress and the displacement, these are usually the most important simulations. Before starting a stress study, you should always try to create goals on why you're conducting the study, this way it will be easier to see if your design is ok.

Typical process for Stress Analysis. Set expectations Estimate physical behavior using a conceptual model. Preprocessing Define material and boundary conditions (loads and constraints), and specify contact conditions and any mesh preferences. Solving Run the simulation to solve your mathematical representation, and generate the solution. To find a result, the part is divided into smaller elements.

The solution is to employ an iterative computational technique in Inventor Stress Analysis called convergence. Each iteration modifies the mesh, re-runs the simulation, and compares the results to the previous results. Performing a convergence study in Inventor Stress Analysis refines the mesh and reduces the size of the elements, which will theoretically increase the accuracy of the next iteration of results.
