Instantaneous Center of Velocity (ICV): Any point on a rigid body or on its extension that has zero velocity is called the Instantaneous Center of Velocity of the body. Assuming one knows the ICV of a body, one can calculate the velocity of any point A on the body using the equation and recognizing that be definition . This gibes

~~Instantaneous Center of Velocity~~

The instant center of rotation, also called instantaneous velocity center, or also instantaneous center or instant center, is the point fixed to a body undergoing planar movement that has zero velocity at a particular instant of time. At this instant, the velocity vectors of the other points in the body

Instantaneous center of zero velocity acts like absolute center of rotation at the instant considered. we must note it here that it will not be a fixed point in a body nor a fixed point in a plane.

The instant center is also called the instantaneous center of zero velocity (IC). It lies on an imaginary axis of zero velocity, about which the body appears to rotate at a given instant. This axis is always perpendicular to the plane of motion. There are three basic cases to consider when solving problems using the instant center approach.
