Arctic Discourses

How Norway Became an Environmental Pioneer for the World

Both fictional and non-fictional accounts of the Arctic have long been a major source of powerful images of the region, and have thus had a crucial part to play in the history of human activities there. This volume provides a wide-reaching investigation into the discourses involved in such accounts, above all into the consolidation of a discourse of "Arcticism" (modelled on Edward Said's concept of "Orientalism"), but also into the many intersecting discourses of imperialism, nationalism, masculinity, modernity, geography, science, race, ecology, indigeneity, aesthetics, etc. Perspectives originating from inside and outside the Arctic,

along with hybrid positions, are examined, with special attention being given to the textual genres, narratives and figures which they mobilize, together with to the close relationship between the Arctic as an unknown place and the literary imagination. The different chapters address a wide geographical range of texts, providing a necessary supplement to most previous work in the field, and also address the wide variety of genres which flourish under the aegis of Arctic discourse, ranging from exploration accounts, travel-writing, political texts and journalism through diaries and historical documents to novels and novelizations, and including also other media, such as music and opera.

The reception of the periodic system of elements has received little attention. Many historians have studied Mendeleev's discovery of the periodic system, but few have analyzed how the scientific community perceived and employed it. American historian of science Stephen G. Brush concluded that the periodic law had been generally accepted in the United States and Britain and suggested the need to extend this study to other countries. *Early Responses to the Periodic System* is the first collection of comparative studies on the reception, response, and appropriation of the periodic system of elements. This book examines the history of pedagogy and popularization in scientific communities, educational sectors, and popular culture from the 1870s to the 1920s. Fifteen historians of science explore eleven countries (and one region) central to chemical research, including Russia, Germany, the Czech lands, and Japan, one of the few nation-states outside the Western world to participate in nineteenth century scientific research. The collection, organized by nation-state, explores how local actors regarded the new discovery as law, classification, or theoretical interpretation. The section on France discusses how a small but significant group of authors, including Adolphe Wurtz and Édouard Grimaux, introduced the periodic system as support for the atomic theory--not as the final solution to the longstanding quest for a natural classification of elements. The chapter on Germany discusses the role of Lothar Meyer, also awarded The Davy Medal for the discovery of the periodic system. Meyer's role was considered less important, and he was forgotten in his home country, where educational tradition was well established, and the periodic system was not used as a novel didactic approach. In addition to discussing the appropriation of the periodic system, the collection examines metaphysical reflections of nature based on the periodic system outside of chemistry and considers how far we can push the categories of "response" and "reception."
