The RDMA API implementation was introduced to the Linux kernel in version 2.6.11. At the beginning, it supported only InfiniBand, and after several kernel versions, iWARP and RoCE support were added to it as well. When describing the API, I mention only one of them, but the following text refers to all.

neard (<http://git.kernel.org/?p=network/nfc/neard.git;a=summary>) is the Linux NFC daemon that runs on top of the kernel NFC APIs. It is a single threaded, GLib based process that implements the higher layers of the NFC peer-to-peer stack along with the four tag types specific commands for reading from and writing to NFC tags.

The IPv6 NAT implementation is mainly based on the IPv4 implementation and provides, from a user perspective, an interface similar to IPv4. IPv6 NAT support was merged in kernel 3.7. It provides some features like an easy solution to load balancing (by setting a DNAT on incoming traffic) and more.
