The Modbus protocol establishes the format for the master's query by placing into it the device (or broadcast) address, a function code defining the requested action, any data to be sent, and an error-checking field. The slave's response message is also constructed using Modbus protocol. It contains fields confirming the action

Modbus Reference Modbus is a reasonably old protocol but is popular for enabling communications between PLCs and other industrial equipment, and is one of the protocols supported for connecting to your asset in Octave (see Modbus Guides for instructions).

~~***Modbus Reference – docs.octave.dev***~~

Modbus TCP is the protocol designed for transmitting Modbus frames using TCP/IP stack, typically over Ethernet physical layer. There are two ways Modbus and TCP can work together. One is the actual Modbus TCP protocol, the other is Modbus RTU-over-TCP. Modbus TCP vs RTU-over-TCP. In both cases, TCP is a transport protocol that carries Modbus messages.
