Oral Motor Development In Down Syndrome

This book provides a detailed account of intellectual, other neuropsychological and behavioral manifestations of general pediatric diseases. The conditions discussed include the whole range of pediatric diseases - genetic syndromes, other congenital conditions, metabolic, endocrine, gastrointestinal, infectious, immunologic, toxic, trauma, and neoplastic, as well as sensory disabilities including deafness and blindness. Although the book is not intended to discuss cognitive and behavioral manifestations of conditions usually considered

be primary neurological disease, some of those, including cerebral palsy, muscular dystrophy, myotonic dystrophy and epilepsy, are included. Where possible, a "translational" approach is used, linking the behavioral and cognitive manifestations of these conditions, to the underlying structural, chemical or genetic abnormalities and their effect on the brain, and, in turn, on behavior and cognition. At the same time, included are significant psychosocial factors. Together, those factors have a major effect on patients' performance, including school performance, and on their families. This book is unique in its extensive coverage of the major pediatric conditions and of the detailed neurological, neuropsychological and behavioral aspects of each condition.

This book provides a concise yet comprehensive source of current information on Down syndrome. Research workers, scientists, medical graduates and paediatricians will find it an excellent source for reference and review. This book focuses on exciting areas of research on prenatal diagnosis - Down syndrome screening after assisted reproduction techniques, noninvasive techniques, genetic counselling and ethical issues. Whilst aimed primarily at research workers on Down syndrome, we hope that the appeal of this book will extend beyond the narrow confines of academic interest and be of interest to a wider audience, especially parents and relatives of Down syndrome patients.

Therapies and Rehabilitation in Down Syndrome covers the

entire lifespan of a DS patient, from infancy to 60 years and beyond, focusing not simply on identifying problems, but providing a detailed look at major therapeutic approaches. Discussion includes future genetic therapy, questions of quality of life, hormone and other therapies for medical problems, prevention and treatment of normal and pathological aging, as well as psychomotoric rehabilitation. This is an important book not only for scientists concerned with various facets of DS, but practitioners looking for guidelines for therapies and clinical application of research findings.

The updated and expanded 2nd edition of FINE MOTOR SKILLS IN CHILDREN WITH DOWN SYNDROME continues to be a popular, practical guide to understanding fine motor skills in children with Down syndrome and helping them develop these skills from birth through early adolescence. The first edition won a Parent's

Choice Award in 1999. The author, an occupational therapist who has worked extensively with children with Down syndrome, is also the parent of a teenager with Down syndrome. She offers parents and professionals dozens of easy, home- and school-based activities, illustrated with black and white photos, which help children gradually acquire the skills they need for fine motor development. Readers learn how to incorporate work on fine motor skills into everyday activities and routines and to emphasise tasks that children can use throughout life -- play, self-help, printing, cutting with scissors, and

Parents learn strategies that can help children handle various sensory problems so they can continue to learn daily living skills. Bruni includes new information on determining when a child is ready for 'pre-printing' activities (things a child can do to prepare for trying to print letters) and how to introduce related concepts (up & down; top & bottom; start & stop; left & right). The 2nd edition also includes more information on ways to help children learn self-help skills, such

understanding of the nature of motor speech disorders from a cross-language perspective, in contrast to the largely English-centric nature of research and practice recommendations to date. The book looks not just at how these motor speech disorders are assessed and treated in other countries, but also examines how underlying speech impairments differ according to the language someone speaks. The book studies the underlying neurological, neurophysiological and neurophonetic characteristics of motor speech disorders in different language contexts, and discusses the implications these have for clinical

The management of and attitudes toward children and adults with Down syndrome have undergone considerable changes in the course of the condition's long history (Zellweger, 1977, 1981, Zellweger & Patil, 1987). J. E. D. Esquirol (1838) and E. Seguin (1846) were probably the first physicians to witness the condition without using currently accepted diagnostic designations. Seguin coined the terms *furfuraceus* or *lowland cretinism* in contradistinction to the *goiterous cretinism* endemic at that time in the Swiss Alps. Esquirol, as well as Seguin, had a positive attitude toward persons who were mentally ill

or mentally subnormal. Esquirol pioneered a more humane treatment in mental institutions and Seguin created the first homes in France, and later in the United States, aimed at educating persons who were mentally subnormal. The term mongolian idiocy was coined by J. H. L. Down in England (1866). The term is misleading in several respects: (1) Down identified the epicanthic folds seen in many children with Down syndrome with the additional skin fold in the upper lid occurring particularly in people of Oriental (Mongolian) descent; and (2) Down also erred by assuming that Down syndrome represented

regression to an ethnic variant of lower cultural standing. Such an interpretation might have been understandable at a time when the myth of Anglo-Saxon superiority was widely accepted by the British. Charles Darwin's then highly acclaimed theory of origin of the species may have contributed to such a concept.

SLI group presented a mild-moderate speech disorder and DS group moderate-severe. Following skills were evaluated: nonverbal intelligence, PM, and oral motor coordination (oral-DDK). The Iowa Oral Performance Instrument (IOPI) was used for the measurement of physiological variables (strength and endurance of tongue and lips). Percentage of consonants correct (PCC) was found. coordination, and physiological variables are factors associated with SSD in teenagers with DS. However, SSD in children with SLI only are associated to phonological memory. Motor coordination and physiological variables are not involved in their SSD of mild and moderate-severe levels. We have objectively measured the strength and endurance of tongue and lips. This may have clinical implications. It is necessary to assess objectively all the variables affecting articulatory accuracy to design intervention programs in SSD.
