*of Eye Color Drosophila melanogaster - ResearchGate*

Drosophila melanogaster is a species of fly (the taxonomic order Diptera) in the family Drosophilidae. The species is known generally as the common fruit fly or vinegar fly. Starting with Charles W. Woodworth's proposal of the use of this species as a model organism, *D. melanogaster* continues to be widely used for biological research in genetics, physiology, microbial pathogenesis, and life ...

eye-color mutants (white, scarlet, vermilion, brown) did not show changes in the ommatidia arrangement or ultrastructure [24,58,59]. There are reports about *D. melanogaster* retina degeneration due to the effect of constant light exposure [60–63]. Described modifications became aggravated with age.

### *Characterisation of white and yellow eye colour mutant ...*

If scarlet-eyed *Drosophila* are crossed with brown-eyed *Drosophila*, then the F1 generation will all be wild-type and the F2 generation will have wild-type, scarlet, brown and white eyes because it is an autosomal dihybrid cross. In butanol only orange pigments appeared, and in acetic acid, orange and red pigments were seen.

### *Mode of Inheritance for Eye Color in Drosophila Melanogaster*

Since the discovery of many eye color mutants, the eye color pigments of *Drosophila melanogaster* have been the subject of numerous investigations. Two classes of pigments, the brown “ommochromes” and the red “drospterins”, contribute to the typical eye color phenotype of *Drosophila* and serve as light-screening pigments. The biosynthetic pathways of these two pigments are distinct and do not share enzymes; ommochromes are synthesized from tryptophan, whereas drospterins are ...

*Biosynthesis of drosopterins, the red eye pigments of*

...

There are two in D.mel.: white+scarlet for brown pigments and white+brown for red ones. Therefore, scarlet and brown double mutants are white eyed. Most other genes involved in eye pigmentation ...

*Can anyone explain the eye color in Drosophila ...*

Animals. Adult fruit flies, *Drosophila melanogaster* Meigen, were from stocks held at 25°C in a 12 h:12 h light:dark cycle on a standard cornmeal and molasses medium. The following genotypes were used: Oregon R wild-type and corresponding eye color mutants, w 1118 (a null white allele); bw 1 (a strong brown allele); st 1 (scarlet); e 1 (ebony); t 1 (tan), and double mutants: w 1118; e 1 and w ...

*Drosophila ABC transporter mutants white, brown and ...*

white, abbreviated w, was the first sex-linked mutation discovered, found in the fruit fly *Drosophila melanogaster*. In 1910 Thomas Hunt Morgan and Lilian Vaughan Morgan collected a single male white-eyed mutant from a population of *Drosophila melanogaster* fruit flies, which usually have dark brick red compound eyes. Upon crossing this male with wild-type female flies, they found that the ...
