"Snow Leopards - Biodiversity of the World Conservation From Genes to Landscapes" New snow leopard book is the "work of a cadre of dedicated and passionate individuals who believe the snow leopard deserves forever to be a living icon of Asia's high peaks." by Sibylle Noras on July 13, 2016

~~"Snow Leopards - Biodiversity of the World Conservation ...~~

The Snow Leopard is not a very aggressive cat, so it's main role in it's habitat is keeping populations in check by being a predator to Marmots, Wild Sheep, and Goats. Because these creatures reproduce at a relatively fast rate, without the Snow Leopard vegetation would be overeaten, resulting in loss of food supply for insects and many species of birds.

~~Ecology - The Snow Leopard~~

Snow leopards are apex predators, meaning they play a key role in maintaining the biodiversity in an ecosystem. Through population dynamics and trophic cascades, snow leopards are an important indicator of the health of the environment and help regulate the populations of species lower on the food chain.

~~Uncia uncia (snow leopard) - Animal Diversity Web~~

They are perfectly adapted to life in the cold, rugged mountain terrains. Snow leopards are also the apex predator of their habitat and usually predate on mountain sheep and goats. However, with less prey in the wild, snow leopards prey on livestock which can influence the perspective and behaviour of local communities.

In 2009, the Snow Leopard Trust funded the research required to crack the code of snow leopard DNA and answer the question of genetic health and diversity. Dr. Lisette Waits conducted the DNA study at the University of Idaho, and the resulting technique is now a valuable new tool that helps us determine snow leopard population sizes and their overall genetic health.
