Chemical reactions can also morph your perfume on the shelf. Visible light has enough energy to bust the bonds in fragrance molecules, and bright sun will singe your perfume in as little as a week [source: Turin and Sanchez]. Air can also corrode your fragrance by oxidation -- the same process that turns uncorked wine into vinegar.

Perfume Chemistry | HowStuffWorks

An aroma compound, also known as an odorant, aroma, fragrance, or flavor, is a chemical compound that has a smell or odor. For a chemical compound to have a smell or odor it must be sufficiently volatile to be transported to the olfactory system in the upper part of the nose. Generally molecules meeting this specification have molecular weights of less than 310. Flavors affect both the sense of taste and smell, whereas fragrances affect only smell. Flavors tend to be naturally occurring, and fra
