Translucent (transparent or “see-through”) paint allows more light to pass through them, refracting the color. Opaque paints are more reflective (not to be confused with “shiny”). They sit on a surface, preventing light from passing through them. The opacity of a paint color is determined by how it interacts with a light source.

Whether a particular color is transparent or opaque has to do simply with its inherent chemical makeup. An opaque color will offer more coverage than a transparent one; that much is obvious. But it is important to remember that opacity and transparency have nothing to do with color saturation/intensity or color permanence.
